Protocol for the Examination of Specimens From Patients With Invasive Carcinoma of Renal Tubular Origin

Wilms tumors and tumors of urothelial origin are not included.

Based on AJCC/UICC TNM, 7th edition
Protocol web posting date: October 2013

Procedures
• Incisional Biopsy (Needle or Wedge)
• Partial Nephrectomy
• Radical Nephrectomy

The College does not permit reproduction of any substantial portion of these protocols without its written authorization. The College hereby authorizes use of these protocols by physicians and other health care providers in reporting on surgical specimens, in teaching, and in carrying out medical research for nonprofit purposes. This authorization does not extend to reproduction or other use of any substantial portion of these protocols for commercial purposes without the written consent of the College.

The CAP also authorizes physicians and other health care practitioners to make modified versions of the Protocols solely for their individual use in reporting on surgical specimens for individual patients, teaching, and carrying out medical research for non-profit purposes.

The CAP further authorizes the following uses by physicians and other health care practitioners, in reporting on surgical specimens for individual patients, in teaching, and in carrying out medical research for non-profit purposes: (1) Dictation from the original or modified protocols for the purposes of creating a text-based patient record on paper, or in a word processing document; (2) Copying from the original or modified protocols into a text-based patient record on paper, or in a word processing document; (3) The use of a computerized system for items (1) and (2), provided that the protocol data is stored intact as a single text-based document, and is not stored as multiple discrete data fields.

Other than uses (1), (2), and (3) above, the CAP does not authorize any use of the Protocols in electronic medical records systems, pathology informatics systems, cancer registry computer systems, computerized databases, mappings between coding works, or any computerized system without a written license from the CAP.

Any public dissemination of the original or modified protocols is prohibited without a written license from the CAP.

The College of American Pathologists offers these protocols to assist pathologists in providing clinically useful and relevant information when reporting results of surgical specimen examinations of surgical specimens. The College regards the reporting elements in the “Surgical Pathology Cancer Case Summary” portion of the protocols as essential elements of the pathology report. However, the manner in which these elements are reported is at the discretion of each specific pathologist, taking into account clinician preferences, institutional policies, and individual practice.

The College developed these protocols as an educational tool to assist pathologists in the useful reporting of relevant information. It did not issue the protocols for use in litigation, reimbursement, or other contexts. Nevertheless, the College recognizes that the protocols might be used by hospitals, attorneys, payers, and others. Indeed, effective January 1, 2004, the Commission on Cancer of the American College of Surgeons mandated the use of the required data elements of the protocols as part of its Cancer Program Standards for Approved Cancer Programs. Therefore, it becomes even more important for pathologists to familiarize themselves with these documents. At the same time, the College cautions that use of the protocols other than for their intended educational purpose may involve additional considerations that are beyond the scope of this document.

The inclusion of a product name or service in a CAP publication should not be construed as an endorsement of such product or service, nor is failure to include the name of a product or service to be construed as disapproval.
CAP Kidney Protocol Revision History

Version Code
The definition of the version code can be found at www.cap.org/cancerprotocols.

Version: Kidney 3.2.0.0

Summary of Changes
The following changes have been made since the June 2012 release.

Nephrectomy, Partial or Radical

Macroscopic Extent of Tumor
“Primary tumor cannot be assessed” and “No evidence of primary tumor” were added.
“Major calyx” and “Minor calyx” were added beneath “Tumor extension in the pelvicaliceal system” as follows:
___ Tumor extension into pelvicaliceal system
   + ___ Major calyx
   + ___ Minor calyx

Microscopic Extent of Tumor
“Primary tumor cannot be assessed” and “No evidence of primary tumor” were added.

Primary Tumor (pT)
pT1, pT2, and pT3 were changed from selectable to nonselectable elements, as follows:

Primary Tumor (pT)
___ pTX: Primary tumor cannot be assessed
___ pT0: No evidence of primary tumor
pT1: Tumor 7 cm or less in greatest dimension, limited to the kidney
   ___ pT1a: Tumor 4 cm or less in greatest dimension, limited to the kidney
   ___ pT1b: Tumor more than 4 cm but not more than 7 cm in greatest dimension, limited to the kidney
pT2: Tumor more than 7 cm in greatest dimension, limited to the kidney
   ___ pT2a: Tumor more than 7 cm but less than or equal to 10 cm in greatest dimension, limited to the kidney
   ___ pT2b: Tumor more than 10 cm, limited to the kidney
pT3: Tumor extends into major veins or perinephric tissues but not into the ipsilateral adrenal gland and not beyond Gerota’s fascia
   ___ pT3a: Tumor grossly extends into the renal vein or its segmental (muscle containing) branches, or tumor invades perirenal and/or renal sinus fat but not beyond Gerota’s fascia
   ___ pT3b: Tumor grossly extends into the vena cava below the diaphragm
   ___ pT3c: Tumor grossly extends into vena cava above diaphragm or invades the wall of the vena cava
___ pT4: Tumor invades beyond Gerota’s fascia (including contiguous extension into the ipsilateral adrenal gland)
Surgical Pathology Cancer Case Summary

Protocol web posting date: October 2013

KIDNEY: Biopsy

Note: Use of case summary for biopsy specimens is optional.

Select a single response unless otherwise indicated.

+ Procedure
+ ___ Incisional biopsy, needle
+ ___ Incisional biopsy, wedge
+ ___ Other (specify): ___________________________
+ ___ Not specified

+ Specimen Laterality
+ ___ Right
+ ___ Left
+ ___ Not specified

+ Histologic Type (Note A)
+ ___ Clear cell renal cell carcinoma
+ ___ Multilocular clear cell renal cell carcinoma
+ ___ Papillary renal cell carcinoma
+ ___ Chromophobe renal cell carcinoma
+ ___ Carcinoma of the collecting ducts of Bellini
+ ___ Renal medullary carcinoma
+ ___ Translocation carcinoma (Xp11 or others)
+ ___ Carcinoma associated with neuroblastoma
+ ___ Mucinous tubular and spindle cell carcinoma
+ ___ Tubulocystic renal cell carcinoma
+ ___ Renal cell carcinoma, unclassified
+ ___ Other (specify): ___________________________

+ Sarcomatoid Features (Note B)
+ ___ Not identified
+ ___ Present
      + Specify percentage of sarcomatoid element: _____%

+ Histologic Grade (Fuhrman Nuclear Grade) (Note C)
+ ___ Not applicable
+ ___ GX: Cannot be assessed
+ ___ G1: Nuclei round, uniform, approximately 10 µm; nucleoli inconspicuous or absent
+ ___ G2: Nuclei slightly irregular, approximately 15 µm; nucleoli evident
+ ___ G3: Nuclei very irregular, approximately 20 µm; nucleoli large and prominent
+ ___ G4: Nuclei bizarre and multilobated, 20 µm or greater, nucleoli prominent, chromatin clumped

+ Data elements preceded by this symbol are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
+ Additional Pathologic Findings
+ ___ None identified
+ ___ Other pathology present (specify): ___________________________

+ Comment(s)
Surgical Pathology Cancer Case Summary

Protocol web posting date: October 2013

KIDNEY: Nephrectomy, Partial or Radical

Select a single response unless otherwise indicated.

Procedure (Note D)
___ Partial nephrectomy
___ Radical nephrectomy
___ Other (specify): ____________________________
___ Not specified

Specimen Laterality
___ Right
___ Left
___ Not specified

Tumor Site (select all that apply)
+ ___ Upper pole
+ ___ Middle
+ ___ Lower pole
+ ___ Other (specify): ____________________________
+ ___ Not specified

Tumor Size (largest tumor if multiple)
Greatest dimension: ___ cm
+ Additional dimensions: ___ x ___ cm
___ Cannot be determined (see “Comment”)

Tumor Focality
___ Unifocal
___ Multifocal

Macroscopic Extent of Tumor (select all that apply) (Note E)
___ Primary tumor cannot be assessed
___ No evidence of primary tumor
___ Tumor limited to kidney
___ Tumor extension into perinephric tissues
___ Tumor extension into renal sinus
___ Tumor extension beyond Gerota’s fascia
___ Tumor extension into major veins (renal vein or its segmental (muscle containing) branches, inferior vena cava)
___ Tumor extension into pelvicaliceal system
   + ___ Major calyx
   + ___ Minor calyx
___ Tumor extension into adrenal gland
   ___ Direct invasion (T4)
   ___ Noncontiguous (M1)
___ Tumor extension into other organ(s)/structure(s) (specify): _____________

+ Data elements preceded by this symbol are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
Histologic Type (Note A)
___ Clear cell renal cell carcinoma
___ Multilocular clear cell renal cell carcinoma
___ Papillary renal cell carcinoma
___ Chromophobe renal cell carcinoma
___ Carcinoma of the collecting ducts of Bellini
___ Renal medullary carcinoma
___ Translocation carcinoma (Xp11 or others)
___ Carcinoma associated with neuroblastoma
___ Mucinous tubular and spindle cell carcinoma
___ Tubulocystic renal cell carcinoma
___ Renal cell carcinoma, unclassified
___ Other (specify): ________________________

Sarcomatoid Features (Note B)
___ Not identified
___ Present
   Specify percentage of sarcomatoid element: ____%

+ Tumor Necrosis (any amount)
+ ___ Not identified
+ ___ Present

Histologic Grade (Fuhrman Nuclear Grade) (Note C)
___ Not applicable
___ GX: Cannot be assessed
___ G1: Nuclei round, uniform, approximately 10 µm; nucleoli inconspicuous or absent
___ G2: Nuclei slightly irregular, approximately 15 µm; nucleoli evident
___ G3: Nuclei very irregular, approximately 20 µm; nucleoli large and prominent
___ G4: Nuclei bizarre and multilobated, 20 µm or greater, nucleoli prominent, chromatin clumped
___ Other (specify): ________________________

Microscopic Tumor Extension (select all that apply)
___ Primary tumor cannot be assessed
___ No evidence of primary tumor
___ Tumor limited to kidney
___ Tumor extension into perinephric tissue (beyond renal capsule)
___ Tumor extension into renal sinus
___ Tumor extension beyond Gerota’s fascia
___ Tumor extension into major vein (renal vein or its segmental (muscle containing) branches, inferior vena cava)
___ Tumor extension into pelvicalyceal system
___ Tumor extension into adrenal gland
   ___ Direct invasion (T4)
   ___ Noncontiguous (M1)
___ Tumor extension into other organ(s)/structure(s) (specify): ________________

+ Data elements preceded by this symbol are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
Margins (select all that apply) (Note F)

___ Cannot be assessed
___ Margins uninvolved by invasive carcinoma
___ Margin(s) involved by invasive carcinoma
    ___ Renal parenchymal margin (partial nephrectomy only)
    ___ Renal capsular margin (partial nephrectomy only)
    ___ Perinephric fat margin (partial nephrectomy only)
    ___ Gerota’s fascial margin
    ___ Renal vein margin
    ___ Ureteral margin
    ___ Other (specify): ____________________________

+ Lymph-Vascular Invasion
   (excluding renal vein and its muscle containing segmental branches and inferior vena cava)
+ ___ Not identified
+ ___ Present
+ ___ Indeterminate

Pathologic Staging (pTNM) (Note G)

TNM Descriptors (required only if applicable) (select all that apply)
___ m (multiple primary tumors)
___ r (recurrent)
___ y (posttreatment)

Primary Tumor (pT)
___ pTX: Primary tumor cannot be assessed
___ pT0: No evidence of primary tumor
pT1: Tumor 7 cm or less in greatest dimension, limited to the kidney
    ___ pT1a: Tumor 4 cm or less in greatest dimension, limited to the kidney
    ___ pT1b: Tumor more than 4 cm but not more than 7 cm in greatest dimension, limited to the kidney
pT2: Tumor more than 7 cm in greatest dimension, limited to the kidney
    ___ pT2a: Tumor more than 7 cm but less than or equal to 10 cm in greatest dimension, limited to the kidney
    ___ pT2b: Tumor more than 10 cm, limited to the kidney
pT3: Tumor extends into major veins or perinephric tissues but not into the ipsilateral adrenal gland and not beyond Gerota’s fascia
    ___ pT3a: Tumor grossly extends into the renal vein or its segmental (muscle containing) branches, or tumor invades perirenal and/or renal sinus fat but not beyond Gerota’s fascia
    ___ pT3b: Tumor grossly extends into the vena cava below the diaphragm
    ___ pT3c: Tumor grossly extends into vena cava above diaphragm or invades the wall of the vena cava
___ pT4: Tumor invades beyond Gerota’s fascia (including contiguous extension into the ipsilateral adrenal gland)
Regional Lymph Nodes (pN)
___ pNX: Regional lymph nodes cannot be assessed
___ pN0: No regional lymph node metastasis
___ pN1: Metastasis in regional lymph node(s)

___ No nodes submitted or found

Number of Lymph Nodes Examined
Specify: ___
___ Number cannot be determined (explain): ______________________

Number of Lymph Nodes Involved
Specify: ___
___ Number cannot be determined (explain): ______________________

Distant Metastasis (pM)
___ Not applicable
___ pM1: Distant metastasis

Pathologic Findings in Nonneoplastic Kidney (select all that apply) (Note H)
___ Insufficient tissue (partial nephrectomy specimen with <5 mm of adjacent nonneoplastic kidney)
___ Significant pathologic alterations
    ___ None identified
    ___ Glomerular disease (specify type): ________________________
    ___ Tubulointerstitial disease (specify type): ____________________
    ___ Vascular disease (specify type): _____________________________
    ___ Other (specify): _____________________________

+ Other Tumors and/or Tumor-like Lesions (select all that apply)
  + ___ Cyst(s) (specify type): __________________________
  + ___ Tubular (papillary) adenoma(s)
  + ___ Other (specify): ___________________________

+ Comment(s)

+ Data elements preceded by this symbol are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
Explanatory Notes

A. Histologic Type
The histopathologic classification published by the World Health Organization (WHO)\(^1\) and the Armed Forces Institute of Pathology\(^2\) is recommended for usage.

- Clear cell renal cell carcinoma
- Multilocular clear cell renal cell carcinoma
- Papillary renal cell carcinoma\(^*\)
- Chromophobe renal cell carcinoma
- Carcinoma of the collecting ducts of Bellini
- Renal medullary carcinoma
- Xp11 translocation carcinomas
- Carcinoma associated with neuroblastoma
- Mucinous tubular and spindle cell carcinoma
- Tubulocystic renal cell carcinoma \(^**\)
- Renal cell carcinoma, unclassified

\(^*\) Papillary carcinoma is commonly separated into type 1 and type 2 based mainly on cytomorphological features.\(^1\)

\(^**\) Tubulocystic carcinoma is a distinct low-grade variant of renal cell carcinoma that was not listed in the 2004 WHO classification. Recent papers have elucidated the nature of this tumor.\(^3\)-\(^5\) This tumor had been previously referred to as a low-grade collecting duct carcinoma.\(^6\) Additionally, there are a variety of other uncommon and emerging carcinomas described in the recent literature.\(^7\)

Occasionally more than one histologic type of carcinoma occurs within the same kidney specimen. Each tumor type should be separately recorded along with its associated prognostic factors.

B. Sarcomatoid Features
Sarcomatoid carcinoma is not a specific morphogenetic subtype of renal cell carcinoma but is considered as a pattern of dedifferentiation.\(^1,2\) Sarcomatoid change in a renal cell carcinoma is associated with an adverse outcome.\(^8\) Sarcomatoid morphology may be found in renal cell carcinomas of clear cell, papillary, chromophobe, collecting duct, and unclassified subtypes.\(^9\)-\(^14\) When the background carcinoma subtype is recognized, it should be specified under histologic type (see Note A). Pure sarcomatoid carcinoma or sarcomatoid carcinoma associated with epithelial elements that do not conform to usual renal carcinoma cell types should be considered as unclassified renal cell carcinoma.

There is some indication that the percentage of sarcomatoid component in a renal cell carcinoma has prognostic importance.\(^13,14\)

C. Histologic Grade
The following grading scheme for renal cell carcinoma developed by Fuhrman et al is recommended and shown below.\(^15\) Beyond clear cell renal cell carcinoma, Fuhrman grading has not been fully established for each histologic subtype of renal parenchymal neoplasia.\(^16\) The protocol does not preclude the use of other grading schemes.\(^16,17\) The system of grading should be specified in the pathologist’s report. Scoring is based on the worst (highest) grade present in the tumor even if it constitutes only a minor component.
Fuhrman Grading System
Grade X  Cannot be assessed
Grade 1 Nuclei round, uniform, approximately 10 µm in diameter; nucleoli inconspicuous or absent
Grade 2 Nuclei slightly irregular, approximately 15 µm in diameter; nucleoli evident
Grade 3 Nuclei very irregular, approximately 20 µm in diameter; nucleoli large and prominent
Grade 4 Nuclei bizarre and multilobated, 20 µm or greater in diameter, nucleoli prominent, chromatin clumped

D. Specimen Type
A standard radical nephrectomy specimen consists of the entire kidney including the calyces, pelvis, and a variable length of ureter. The adrenal gland is usually removed en bloc with the kidney. The entire perirenal fatty tissue is removed to the level of Gerota's fascia, a membranous structure that is similar to the consistency of the renal capsule that encases the kidney in perirenal fat. Variable lengths of the major renal vessels at the hilus are submitted.

Regional lymphadenectomy is not generally performed even with a radial nephrectomy. A few lymph nodes may occasionally be seen in the renal hilus around major vessels. Other regional lymph nodes (eg, paracaval, para-aortic, and retroperineal) may be submitted separately.

A partial nephrectomy specimen may vary from a simple enucleation of the tumor to part of a kidney containing variable portions of calyceal or renal pelvic collecting system. The perirenal fat immediately overlying the resected portion of the kidney but not to a level of Gerota's fascia is usually included.

E. Macroscopic Extent of Tumor
A careful gross analysis and description of tumor extension in a nephrectomy specimen is important and should guide blocking of tissue samples for histologic assessment. Careful documentation of the tumor extension beyond kidney into perinephric fat and Gerota's fascia provides important staging information. Renal sinus fat involvement in renal cell carcinoma is an under-recognized phenomenon. The renal sinus is an important pathway of spread of renal cell carcinoma (Figure 1, A and B). The renal sinus fat should be carefully assessed and generously sampled in order to detect renal sinus fat involvement. There is evolving literature suggesting that renal sinus fat involvement predicts a more aggressive outcome than peripheral perinephric fat invasion. When renal carcinoma involves adrenal gland, it is important to document whether the involvement is contiguous spread of tumor or a separate (noncontiguous) nodule of carcinoma, the latter representing metastatic disease (pM1) (Figure 2).
Figure 1. A, Diagram showing the renal sinus fat (S) and its rich venous system that envelops the collecting system. The renal capsule terminates (arrow) just inside the vestibule of the hilus. B, A renal malignancy is constrained by the renal capsule (arrow), yet no fibrous capsule impedes its growth into the vascular tissue of the renal sinus (curved arrows). From Bonsib et al.\textsuperscript{18} Reproduced with permission of the American Journal of Surgical Pathology. © 2000 Wolters Kluwer Health.
Figure 2. Diagram showing relationship between local tumor extension and pT designation. When a tumor shows direct invasion into the perirenal fat or renal sinus fat it is designated as pT3a. A tumor that directly invades the adrenal gland is designated as pT4 while a tumor that shows discontinuous (noncontiguous) involvement of the adrenal gland is considered metastatic (M1).

F. Margins

In a partial nephrectomy specimen, the renal parenchymal margin should be inked and histologically assessed. Most partial nephrectomy specimens also contain a portion of perinephric fat overlying the tumor site. The perirenal fat margin should also be assessed. In situations where no perirenal fat is present, the renal capsular margin should be inked and examined histologically.

In radical nephrectomy specimens the ureteric, major vascular (renal vein, renal artery) and soft tissue (Gerota’s fascia, renal sinus) margins should be examined and documented in the report.

G. TNM and Stage Groupings

The TNM staging system of the American Joint Committee on Cancer (AJCC) and the International Union Against Cancer (UICC) for renal cell carcinoma is recommended.\textsuperscript{21,22}

By AJCC/UICC convention, the designation “T” refers to a primary tumor that has not been previously treated. The symbol “p” refers to the pathologic classification of the TNM, as opposed to the clinical classification, and is based on gross and microscopic examination. pT entails a resection of the primary tumor or biopsy adequate to evaluate the highest pT category, pN entails removal of nodes adequate to validate lymph node metastasis, and pM implies microscopic examination of distant lesions. Clinical classification (cTNM) is usually carried out by the referring physician before treatment during initial evaluation of the patient or when pathologic classification is not possible.

Pathologic staging is usually performed after surgical resection of the primary tumor. Pathologic staging depends on pathologic documentation of the anatomic extent of disease, whether or not the primary tumor has been completely removed. If a biopsied tumor is not resected for any reason (eg, when technically unfeasible) and if the highest T and N categories or the M1 category of the tumor can be
confirmed microscopically, the criteria for pathologic classification and staging have been satisfied without total removal of the primary cancer.

**Stage Groupings**

<table>
<thead>
<tr>
<th>Stage</th>
<th>T</th>
<th>N</th>
<th>M</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>1</td>
<td>0</td>
<td>0#</td>
</tr>
<tr>
<td>II</td>
<td>2</td>
<td>0</td>
<td>M0</td>
</tr>
<tr>
<td>III</td>
<td>T1 or T2</td>
<td>N1</td>
<td>M0</td>
</tr>
<tr>
<td></td>
<td>T3</td>
<td>N0 or N1</td>
<td>M0</td>
</tr>
<tr>
<td>IV</td>
<td>T4</td>
<td>Any N</td>
<td>M0</td>
</tr>
<tr>
<td></td>
<td>Any T</td>
<td>Any N</td>
<td>M1</td>
</tr>
</tbody>
</table>

# M0 is defined as no distant metastasis.

**TNM Descriptors**

For identification of special cases of TNM or pTNM classifications, the “m” suffix and “y,” “r,” and “a” prefixes are used. Although they do not affect the stage grouping, they indicate cases needing separate analysis.

The **“m” suffix** indicates the presence of multiple primary tumors in a single site and is recorded in parentheses: pT(m)NM.

The **“y” prefix** indicates those cases in which classification is performed during or following initial multimodality therapy (ie, neoadjuvant chemotherapy, radiation therapy, or both chemotherapy and radiation therapy). The cTNM or pTNM category is identified by a “y” prefix. The ycTNM or ypTNM categorizes the extent of tumor actually present at the time of that examination. The “y” categorization is not an estimate of tumor prior to multimodality therapy (ie, before initiation of neoadjuvant therapy).

The **“r” prefix** indicates a recurrent tumor when staged after a documented disease-free interval, and is identified by the “r” prefix: rTNM.

The **“a” prefix** designates the stage determined at autopsy: aTNM.

**Additional Descriptors**

**Residual Tumor (R)**

Tumor remaining in a patient after therapy with curative intent (eg, surgical resection for cure) is categorized by a system known as R classification, shown below.

<table>
<thead>
<tr>
<th>RX</th>
<th>Presence of residual tumor cannot be assessed</th>
</tr>
</thead>
<tbody>
<tr>
<td>R0</td>
<td>No residual tumor</td>
</tr>
<tr>
<td>R1</td>
<td>Microscopic residual tumor</td>
</tr>
<tr>
<td>R2</td>
<td>Macroscopic residual tumor</td>
</tr>
</tbody>
</table>

For the surgeon, the R classification may be useful to indicate the known or assumed status of the completeness of a surgical excision. For the pathologist, the R classification is relevant to the status of the margins of a surgical resection specimen. That is, tumor involving the resection margin on pathologic examination may be assumed to correspond to residual tumor in the patient and may be classified as macroscopic or microscopic according to the findings at the specimen margin(s).
**Lymph-Vascular Invasion**

By AJCC/UICC convention, vessel invasion (lymphatic or venous) does not affect the T category indicating local extent of tumor unless specifically included in the definition of a T category. In all other cases, lymphatic and venous invasion by tumor are coded separately.

**H. Pathologic Findings in Nonneoplastic Kidney**

It is important to recognize that medical kidney diseases may be present in nonneoplastic renal tissue in nephrectomy and nephroureterectomy specimens. Arterionephrosclerosis (or hypertensive nephropathy) and diabetic nephropathy are seen in approximately 30% and 20% of cases, respectively. Other medical renal diseases that have been identified include thrombotic microangiopathy, focal segmental glomerulosclerosis, and IgA nephropathy. The findings of greater than 20% global glomerulosclerosis or advanced diffuse diabetic glomerulosclerosis are predictive of significant decline in renal function 6 months after radical nephrectomy. Evaluation for medical renal disease should be performed in each case; PAS and/or Jones methenamine silver stains should applied if necessary. Consultation with a nephropathologist should be pursued as needed.
